# Simultaneous Determination of Paracetamol and Hyoscine-N- Butyl Bromide in Binary Mixture Using Derivative Spectrophotometry and Their Application for Pharmaceutical Samples 

Marwa S. Yonis and Khaleda H. Al-Saidi<br>Department of Chemistry, College of Science, Al-Nahrain University, Baghdad-Iraq.

#### Abstract

Derivative spectrophotometric (first, second, third and fourth derivative) were used for the determination of paracetamol (PAR) and hyoscine n-butyl bromide (HYO) the binary mixture by applying zero-crossing technique for pure synthetic mixture. Also simultaneous determination of PAR and HYO in (SPAZMOTEK PLUS) tablets was applied. PAR was determined by using ${ }^{1} \mathrm{D}$ and ${ }^{2} \mathrm{D}$ methods at 297.4 and 303.5 nm (zero crossing point of HYO) with linear concentration ranges 2-30 $\mu \mathrm{g} . \mathrm{mL}^{-1}$, with correlation coefficient $\mathrm{r}(0.9998,0.9987)$, LOD ( $0.081,0.250 \mu \mathrm{~mL}^{-1}$ ), relative error $(0.68,0.22)$ and $\operatorname{RSD} \% ~(0.107,0.400)$, respectively. HYO was determined by using ${ }^{1}$ D method at 215.9 nm (zero crossing point of PAR) with concentration range $2-25 \mu \mathrm{~g} \mathrm{~mL}$ - , with correlation coefficient 0.9997 and LOD $0.091 \mu \mathrm{~g} \mathrm{~mL}^{-1}$, relative error 1.20 and RSD\% 0.342 . No interference found between both determined and those of matrices. A good accuracy and precision of simultaneous determination of PAR, and HYO were confirmed by statistical analysis. The percentage recovery of the individual drugs under the established conditions is ranged from $95.07 \%$ to $100.93 \%$, the proposed procedures were successfully applied to the determination of these compounds in different ratio by synthetic mixtures and pharmaceutical tablets without requiring any separation step.

Keywords: Paracetamol; Hyoscine-n-butyl bromide; binary mixtures; derivative spectrophotometry; zero-crossing technique.

## Introduction

Paracetamol (PAR), n-(4-hydroxyphenyl) acetamide, which has the empirical formula $\left(\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}\right)$, as shown in Fig.(1), its white, or almost white crystalline powder with molecular weight $151.2 \mathrm{~g} / \mathrm{mole}$, Sparingly soluble in water, freely soluble in alcohol, very slightly soluble in methylene chloride. ${ }^{[1]}$

Hyoscine-n-butyl bromide (HYO) (1R,2R,4S,5S,7s,9r)-9-Butyl-7-[[(2S)-3-hydroxy-2-phenylpropanoyl]oxy]-9-methyl -3-oxa-9- azoniatricyclo [3.3.1.02,4] nonane bromide, which has the empirical formula $\left(\mathrm{C}_{21} \mathrm{H}_{30} \mathrm{BrNO}_{4}\right)$, as shown in Fig.(2), its white, or almost white crystalline powder with molecular weight $440.4 \mathrm{~g} / \mathrm{mole}$, Freely soluble in water and in methylene chloride, sparingly soluble in anhydrous ethanol. ${ }^{[1]}$

Fig.(1): Structure formula of paracetamol.

Fig.(2): Structure formula of Hyoscine -nButylbromide.

## Paracetamol and Hyoscine-n-butyl bromide mixture

The combination of PAR and HYO are used for the relief of smooth muscle spasm (cramps) of the gastrointestinal and genitourinary system, it is effective in the
treatment of recurrent crampy abdominal pain. ${ }^{[2]}$

Various methods have been reported for the simultaneous determination of the combination of PAR and HYO in pharmaceutical formulations and biological fluids, including RP-TLC and HPLC ${ }^{[3-5]}$, and UV spectrophotometry ${ }^{[2]}$, Derivative spectrophotometry (DS) is widely applied for determination for inorganic ions ${ }^{[6,7]}$ and organic analysis, toxicology and clinical analysis, analysis of pharmaceutical products ${ }^{[6-11]}$, amino acids and proteins, in analysis of food and in environmental chemistry. In general, the application of DS is not limited to any particular case or filed, but it can be used whenever quantitative or qualitative investigations of broad spectra are difficult.

In this paper, simultaneous determination of PAR and HYO in spazmotek plus tablets $\mathrm{DS}^{[12]}$. An attempt was made to find suitable derivatives and wavelength for quantitative analysis for PAR and HYO at which both drugs show no interference. As no similar analyses were found in available literature it seems justifiable to develop a simple, quick and easily available spectrophotometric method for drug quality control purposes. This method differs from others it doesn't need any chemical treatment and both drugs can be determined directly in a binary mixture sample without using any separation process.

## Experimental

## Instruments and Equipments

Double-beam UV-Visible spectrophotometer model (UV-1650 PC) SHIMADZO (Japan), interfaced with computer via a SHIMADZU UV probe data system program (Version 1.10), using 1.00 cm quartz cells, ( W . Germany)., Sartorius Handy 4digits Analytical Balance (GMBH, H110, Germany), and Micropipettes ( $200-1000 \mu \mathrm{l}$ ) Swiss made.

## Chemicals

1. Standards paracetamol (PAR) $\left(\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NO}_{2}\right.$; F.W. $151.2 \mathrm{~g} /$ mole) and hyocsine-n-butyl bromide (HYO) $\left(\mathrm{C}_{21} \mathrm{H}_{30} \mathrm{BrNO}_{4} ;\right.$ F.W. $440.4 \mathrm{~g} / \mathrm{mole}$ ) were purchased from the State Company of Drug Industries and Medical Appliances (IRAQ-SDI,

Samarra). All drugs were used as working standards without further purification.
2. Pharmaceuticals drugs: Spazmotek plus tablet (SPAZMOTEK PLUS-500 mg PAR, 10 mg HYO) made by Bilim pharmaceutical limited company (Turkey).
3. Interferences material (Titanium dioxide) obtained from (BDH).

## Preparation of Standard Solutions

1. Stock solutions of $250 \mu \mathrm{gL}^{-1}$ standard for PAR and HYO were prepared by dissolving an accurately weighed amount 25 mg of the studied drugs in distilled water and made up to 100 mL volumetric flask with distilled water. Two series of pure single standards $\left(2-30 \mu \mathrm{~g} \mathrm{~mL}^{-1}\right)$ for PAR and HYO were prepared by diluting stock solutions with distilled water.
2. Solutions for binary mixtures of standard drugs PAR and HYO solutions were prepared by two series. First series of mixture solutions were prepared by using a fixed concentration ( $25 \mu \mathrm{~g} . \mathrm{mL}^{-1}$ ) of PAR with different concent- rations ( 0.5 , $1,2,4,6,8,10,15,20$, and $\left.25 \mu \mathrm{~g} \mathrm{~m}^{-1}\right)$ of HYO, While the second series of mixture contains a fixed concentration $\left(0.5 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}\right)$ of HYO with different concentration ( $2,4,6,8,10,15,20$, and $25 \mu \mathrm{~g} \mathrm{~m}^{-1}$ ) of PAR.
3. Stock solutions ( $250 \quad \mu \mathrm{~g} \mathrm{~mL}^{-1}$ ) of interferences were prepared by dissolving an accurately weighed amount ( 0.0125 g ) of interferences (titanium dioxide) in 50 mL distilled water; the other working solutions were prepared by dilution.

## Preparation of pharmaceuticals samples

Ten tablets of the pharmaceutical HYOPAR (SPAZMOTEK PLUS-500mg PAR, 10 mgHYO ) were weight and grind to fine powder accurately to be found 6.8345 g , then 0.0683 g of this powder was dissolved in 100 mL distilled water then filtered, the clear solution was taken and filed up to 100 mL .

The resultant solutions may be contained $500 \mathrm{mg} / \mathrm{L}(\mathrm{PAR})+10 \mathrm{mg} / \mathrm{L}(\mathrm{HYO})$, The other working solutions were prepared by dilution.

Standard addition method for the pharmaceutical HYO-PAR (SPAZMOTEK

PLUS-500mgPAR, 10 mgHYO ) were prepared by taken fixed volume 5 ml from $0.5 \mu \mathrm{~g} \mathrm{~mL}$ ${ }^{1} \mathrm{HYO}$ from pharmaceutical sample to 7 volumetric flask with different concentrations ( $0,5,8,10,12,15$ and $18 \mu \mathrm{~g} \mathrm{~mL}^{-1}$ ) of standard HYO in 10 mL volumetric flask.

## Results and Discussion

Selection of Optimum Instrumental Conditions
The scaling factor affecting only on the derivative amplitude, weak derivative amplitude needs to high scaling factor to give a good high peak, the suitable scaling factor that chosen to give good peak were $6,25,75$ and 150 for ${ }^{1} \mathrm{D},{ }^{2} \mathrm{D},{ }^{3} \mathrm{D}$ and ${ }^{4} \mathrm{D}$, respectively for PAR and HYO. However, if the value of $\Delta \lambda$ is too large, the spectral intensity signal of the first derivative deteriorates, ${ }^{[13]}$. The suitable
$\Delta \lambda$ that optimized to give a good selectivity were $2,4,8$ and 16 for ${ }^{1} \mathrm{D},{ }^{2} \mathrm{D},{ }^{3} \mathrm{D}$ and ${ }^{4} \mathrm{D}$, respectively for PAR and HYO.

## Binary Mixture: PAR with HYO Mixture

The zero order spectra of standard PAR and HYO were found to be overlapped making the determination unthinkable, as shown in Fig.(3-a).

Fig.(3): Spectra of 8-25 $\mu \mathrm{g} . \mathrm{mL}^{-1}$ PAR 8-25 $\mu \mathrm{g} . \mathrm{mL}^{-1} \mathrm{HYO}$
a- normal spectrum of $25 \mu \mathrm{~m} \mathrm{~mL}^{-1}$ for each PAR and HYO.
$b$ - first derivative( $S=6, \lambda=2$ ).
$c$ - second derivative $(S=25, \lambda=4)$.
$d$ - third derivative ( $S=75, \lambda=8$ ).
$e$-fourth derivative $(S=150, \lambda=16)$.

## First Derivative

First derivative method can be used to determine each of PAR and HYO in their mixtures, as shown in Fig.(3-b). In Fig.(4), PAR can be determined at $\mathrm{V}=257.5$ and $\mathrm{V}=297.4 \mathrm{~nm}$, while HYO have no any contribution. The calibration curve of ${ }^{1} \mathrm{D}$ spectra for standard PAR at 257.5 and 297.4 nm were constructed, as shown in part one. The linear equation, correlation coefficient and concentration range for the calibration curves are listed in Table (1). On the other hand, HYO can be determined at $\mathrm{V}=215.9 \mathrm{~nm}$, where PAR absorbance was nil (zero crossing point of PAR), as shown in

Fig.(5). The calibration curve of ${ }^{1} \mathrm{D}$ spectra for standard HYO at 215.9 nm were constructed, as shown in part one. The linear equation, correlation coefficient, and concentration range for the calibration curve are listed in Table (1). The results of the relative error \% and recovery $\%$ for the determination of PAR and HYO in their mixtures are listed in Tables (2), (3) and (4).

Fig.(4): ${ }^{1}$ D spectra for $8-25 \mu \mathrm{~mL} \mathrm{~L}^{-1} \mathrm{PAR}$ and $8 \mu \mathrm{~mL} \mathrm{~L}^{-1} \mathrm{HYO}$ (zero crossing) at 257.5 and 297.4nm.

| 25PAR + 8 HYO | 8.143 | 1.79 | 101.79 | 20PAR+0.5HYO | 0.512 | 2.40 | 102.40 |
| 25PAR+10 HYO | 10.256 | 2.56 | 102.56 | $25 \mathrm{PAR}+0.5 \mathrm{HYO}$ | 0.506 | 1.20 | 101.20 |

The results of Table (4) show that HYO can be determined with high accuracy by ${ }^{1} \mathrm{D}$ method at $\mathrm{V}=215.9 \mathrm{~nm}$, when the mixture contain ( 0 to more than $50 \% \mathrm{PAR}$ ).

## Second Derivative

Second derivative method can be used to determine PAR only, because there is no suitable wavelength to determine HYO, as shown in Fig.(3-c). In Fig.(6), PAR can be determined at $\mathrm{V}=245.4, \mathrm{P}=268.2$ and $\mathrm{P}=303.5 \mathrm{~nm}$, while HYO have no any contribution; The calibration curve of ${ }^{2} \mathrm{D}$ spectra for standard PAR at 245.4,268.2 and 303.5 nm was constructed, as shown in part one. The linear equation, correlation coefficient and concentration range for the calibration curve are listed in Table (1). The results of the relative errors \% and recovery \% for the determination of PAR in the mixture are listed in Tables (5), (6) and (7).

Fig.(6): ${ }^{2}$ D spectra for $8-25 \mu g m L^{-1}$ PAR and $8 \mu g \mathrm{~mL}^{-1} \mathrm{HYO}$ (zero crossing) at 245.4, 268.2 and 303.5nm.

| $25 \mathrm{PAR}+8 \mathrm{HYO}$ | 24.136 | -3.46 | 96.54 | 20PAR+0.5HYO | 19.705 | -1.48 | 98.53 |
| 25PAR+10HYO | 24.136 | -3.46 | 96.54 | 25PAR+0.5HYO | 25.055 | 0.22 | 100.22 |

The results of Table (7) show that PAR can be determined with high accuracy by ${ }^{2} \mathrm{D}$ method at $\mathrm{P}=303.5 \mathrm{~nm}$, when the mixture contain ( 0 to $50 \% \mathrm{HYO}$ ).

## Third Derivative

Third derivative method can be used to determine PAR only, because there is no suitable wavelength to determine HYO, as shown in Fig.(3-d). In Fig.(7), PAR can be determined at $\mathrm{V}=237.1, \mathrm{~V}=214.0 \mathrm{~nm}$, while HYO have no any contribution; The calibration curve of ${ }^{3} \mathrm{D}$ spectra for standard PAR at 237.1, and 214.0 nm was constructed, as shown in part one. The linear equation, correlation coefficient and concentration range for the calibration curve are listed in Table (1). The results of the relative error $\%$ and recovery \% for the determination of PAR in the mixture are listed in Tables (8) and (9).

Fig.(7): ${ }^{3}$ D spectra for $8-25 \mu \mathrm{~m} \mathrm{~mL}^{-1}$ PAR and $8 \mu \mathrm{~g} \mathrm{~mL}^{-1} \mathrm{HYO}$ (zero crossing) at 237.1 and 214.0nm.

Table (8)

## Interferences Study

To find an effect of matrix constituents on the results of determination, and comparative analysis was carried out for standard solution containing active components at concentrations $\quad(25 \mathrm{PAR}+0.5 \mathrm{HYO}) \quad \mu \mathrm{g} . \mathrm{mL}^{-1}$ comparable to those of the analyzed drug contain the same concentration, they show the same normal spectra Fig.(9-a).While Fig.(9-b) show comparable between standard solution containing active components at concentrations $(25 \mathrm{PAR}+0.5 \mathrm{HYO}) \mu \mathrm{g} \mathrm{mL}{ }^{-1}$
with interfering material (titanium dioxide) at ten time of concentrations ( $25 \mathrm{PAR}+0.5 \mathrm{HYO}$ ) $\mu \mathrm{gmL}$.

Fig.(9): Normal spectra for standard solution containing active components at concentrations (25 PAR+0.5 HYO) $\mu \mathrm{g} \boldsymbol{m L} L^{-1}$ comparative with.
(a) drug contain the same concentration.

## Analysis of Pharmaceutical Samples

SPAZMOTIC PLUS sample ( $25 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ ) was measured by using ${ }^{1} \mathrm{D}$, and ${ }^{2} \mathrm{D}$ methods, as shown in table (13).

> Table (13)

The relative error\% and recovery \%for the determination of PAR in Spazmotic plus sampleb ( $25 \mu \mathrm{~g} \boldsymbol{m} L^{-1}$ PAR $+0.5 \mu \mathrm{~g} m L^{-1}$ HYO) by DS.

| Drugs | Spazmotic plus (PAR) |  |
| :---: | :---: | :---: |

| סn-1 | 0.045 | 0.503 |

Table (13) shows the results for the determination of PAR in Spazmotic plus by ${ }^{1}$ D and ${ }^{2} \mathrm{D}$ methods. The suitable method that gave more accurate result was the ${ }^{2} \mathrm{D}$ method at 303.5 nm for PAR. While HYO cannot be determine by using direct method therefore standard additions method (SAM) was used to determine HYO as shown in Fig.(10). Table (14) shows the comparing between standard and commercial drug by ${ }^{2} \mathrm{D}$ for PAR and ${ }^{1} \mathrm{D}$ for HYO .

Fig.(10): Calibration carve for standard additions method for HYO by using ${ }^{1}$ D method at $V=215.9 \mathrm{~nm}$.

* Each concentration represents an average of at least three measurements.

## Conclusions

A fast and accurate method for determining PAR and HYO was developed by using derivative spectrophotometry. The advantage of this method is that both constituents can be determined directly in binary mixture sample without the need to be separated. It was also found that $\mathrm{D}^{1}, \mathrm{D}^{2}$ is used for determining HYO and PAR, respectively in spazmotic plus tablets.

## Acknowledgments

The authors would like to thank University of Al-Nahrain, for research grant Determination of Paracetamol and Hyoscine-N- Butyl Bromide in Binary Mixture and for financial support and technical assistance on this work.

## الخلاصة

تم استخدام الدشتقتاث الطيفية (الاولى, الثانية, الثالثة
والرابعة) في تعيين الباراسينامول والهايوسين بيوتل برومايد
في مزيج ثنائي وبتقنية النقاطع الصفري للنماذج النقية
والمستحضر الصيدلاني. تم تقاير الباراسينامول و الهايوسين

اما الهايوسين فتّ تنقيره باستخدام المشنقة الاولى في
(

SPAZMOTEK PLUS-) تطبيقـــه علــــى دواء (
(500PAR,10HYO mg
الادوية. النتائج الاحصائية تساند دقة وصخة الطرق

r 9 , . . ( \%). هذه الطريقة سهلة لا تحتّاج الى فصل او اي
